## 1 Executive summary

The raw data and full model posterior with extrapolations are shown in figure 1.

Reduction in MAE (%)

termination  $(R^2)$  values in table 1. The first 3 additive components explain 99.8% of the variation in the data. After the first 3 components the cross validated mean absolute error (MAE) does not decrease by more than 0.1%. This suggests that subsequent terms are modelling very short term trends, uncorrelated noise or are artefacts of the model or search procedure. Short summaries of the

The structure search algorithm has identified four additive components in the data. The first 2 additive components explain 98.5% of the variation in the data as shown by the coefficient of de-

• A linearly increasing function.

additive components are as follows:

- A smooth function.
  Uncorrelated noise with linearly increasing standard deviation.
- An approximately periodic function with a period of 1.0 years and with approximately linearly increasing amplitude.

discrepancies between the model and observed data.

Residual  $R^2$  (%)

-	-	-	-	280.30	-
1	85.4	85.4	85.4	34.03	87.9
2	98.5	13.2	89.9	12.44	63.4
3	99.8	1.3	85.1	9.10	26.8
4	100.0	0.2	100.0	9.10	0.0

determination  $(R^2)$  values are computed using the residuals from the previous fit as the target values; this measures how much of the residual variance is explained by each new component. The mean absolute error (MAE) is calculated using 10 fold cross validation with a contiguous block design; this measures the ability of the model to interpolate and extrapolate over moderate distances. The model is fit using the full data and the MAE values are calculated using this model; this double use of data means that the MAE values cannot be used reliably as an estimate of out-of-sample predictive

Cross validated MAE

performance.

Model checking statistics are summarised in table 2 in section 4. These statistics have not revealed

any inconsistencies between the model and observed data.

The rest of the document is structured as follows. In section 2 the forms of the additive components

are described and their posterior distributions are displayed. In section 3 the modelling assumptions of each component are discussed with reference to how this affects the extrapolations made by the model. Section 4 discusses model checking statistics, with plots showing the form of any detected
